

Have a few focused questions but none that answer each other. Hypothesis' that can be tested by the data set we have.

Did those that exhaust their extensions fail to turn in assignments afterwards?

Did anyone fail an assignment before resorting to an extension?

Aggregate all of Josh's csv files, sort by id and then add them to the Final Score, Final Grade, and Assignment Extensions

- # extensions taken as predictor for the final grade in the class, and how that compares to their overall GPA (outcome) as well. Do they do better in this class vs others or no?
- Reasons for taking an extension (perhaps divided into good and bad reasons?) as a predictor for how many used/final grades in the class?
- Most students who took this survey were from lower-level classes. Is there a correlation between class level and number of extensions taken/reasons for them?
- After taking an extension, how long did it take the student to actually get the assignment in? – need Tylers help to see these times
- Correlation between when the student took the extension as a predictor for what the reason was that they took an extension. (Maybe they should have to use it a day before the deadline?)
- HS education type in predicting comfortability in taking an extension and how many used.
 - How does previous education correlate to the comfortability of taking extensions
 - HS Type, GPA, Extensions #
 - HY Type, GPA, Comfortability
- Is there a significant difference in how valuable education felt (being able to use extensions) between those who took both extensions, only took one extension, and those who took no extensions.

What type of test test, why that type of test, what did it show, what numbers support what you've said?
